

Figure S-1
Seismic Hazards

- - - Fault, concealed
- Moderate to high liquefaction susceptibility. Sediments are young (less than 10,000 years old), unconsolidated, generally fine-grained, and there has been artesian well activity historically.
- Low to moderate liquefaction susceptibility. Sediments are young (less than 10,000 years old), unconsolidated, and generally fine-grained.
- Ontario City Limits
- New Model Colony

This is NOT a liquefaction hazard map. Except for the southwestern corner of the city where shallow ground water has been reported in the past, groundwater levels are too deep for liquefaction to occur. This map shows the approximate distribution of sediments most susceptible to liquefaction.

Notes:
This map is intended for general land use planning only. Information on this map is not sufficient to serve as a substitute for detailed geologic investigations of individual sites, nor does it satisfy the evaluation requirements set forth in geologic hazard regulations.
